

Coronary Artery Disease (CAD)

Coronary artery disease is also called heart disease or atherosclerosis. It is the hardening of the blood vessels by fatty deposits called plaque.

The heart must get oxygen and nutrients to work well. Blood carries the oxygen and nutrients to the heart through the blood vessels called arteries.

As the plaque builds up, blood flow to the heart muscle is decreased. When blood flow is decreased, it can cause chest pain, shortness of breath, or a heart attack to occur.

Your Care

The goal is to improve blood flow to your heart muscle and decrease your risk of heart attack.

Your care may include:

- Medicines
- Exercise
- A low fat diet
- Treatment or Surgery
- A cardiac rehab program

No matter what type of care is done, it does not cure the disease. You need to change your risk factors and follow your care plan.

Talk to your doctor about your care or any questions you may have.
